Region: Europe | Industry: Automotive | Service: AI

Driving from *research* to *readiness*.

Major automotive company drives from research to readiness with AI-assisted testing.

For a large car company managing several web applications, every release required teams to connect tickets, acceptance criteria, configurations, and test data. Manual research consumed time, introduced inconsistency, and made evidence harder to use.

Sogeti introduced an AI assisted, rule based approach that creates traceable analyses, test plans, and ISTQB-aligned test cases. Playwright execution, supported by screenshots, videos, and GIFs, makes results clear and repeatable across release cycles. Across several months and release cycles, preparation became faster, more consistent, and easier to trace.

The team now spends less time collecting and formatting information and more time applying professional judgment. Stakeholders gain clearer evidence, delivery decisions are better informed, knowledge is reused, and every new cycle starts stronger.

"***Working with AI does not reduce the team's responsibility***. It gives the team capacity back; less time collecting and formatting information, more time assessing what test results actually mean."

Solution Owner, *Sogeti*

75% ***time saving in documentation and reporting for specific cases.***

Our local teams work side-by-side with clients, creating outcomes that can scale, ***Right here. Right now.***
