

Improving the *future-state of data.*

Sogeti worked with a U.S. healthcare organization to modernize its provider platform and improve data reliability.

A healthcare organization set out to modernize its provider platform to deliver high-quality, trusted data to customers nationwide. The existing landscape required a clear future-state vision, as well as improved data reliability, consolidation, and quality across legacy systems.

Sogeti designed and implemented a modern data platform using Azure SQL, Azure Data Factory, and Databricks, supported by a future-proof model that consolidated data from across the legacy estate.

Post-migration, customers gained access to records with 98% of records identified as distinct (not duplicates). Overall data quality improved by 20%. The solution also delivered a 20% reduction in effort through GenAI powered data quality, data engineering acceleration, and Copilot.

98% *records now distinct*

20% *data quality improvement*

20% *reduction in effort*

Our local teams work side-by-side with clients, creating outcomes that can scale, ***Right here. Right now.***
